

Constants & suggested values:

- age_min: 12 hours
- age_max: 2 days
- reqs_max: 10?

Each cache record stores:

- bot score
- timestamp for bot score
- tweet rate (see note)
- # of requests; initially 0

Upon storing a cache record, calculate the tweet rate by the time difference between the first and last tweets in the timeline divided by the number of tweets. This rate is used to calculate the expected number of tweets since the cache record was stored.
